## 1 Introduction

This document captures the business and IT requirements for the Bupa Customer Experience Improvement Project. The initiative is based on customer feedback and NPS analysis showing an overall negative NPS score of -44.60, with high detractor volume and recurring concerns around claims handling, response time, and service experience.

## 2 Problem/Impact/Successful Outcome

| The Problem                                                                                            | The Impact                                                                                                                     | The Successful Outcome                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer satisfaction is low and detractor responses are significantly higher than promoter responses. | Negative sentiment can affect retention, brand trust, policy renewal, and service reputation, especially for claimed customers | Bupa improves response quality, reduces customer pain points, and establishes reporting and action tracking that support NPS improvement across product lines and customer journeys. |

## 3 Objectives

| ID   | Business Objective                                                     | Business Owner | Business Importance |
|------|------------------------------------------------------------------------|----------------|---------------------|
| O-01 | Reduce dissatisfaction drivers in customer service and claims journeys | Anita Sharma   | High                |
| O-02 | Improve visibility of NPS by product line, tenure, and claim status    | Rahul Mehta    | High                |
| O-03 | Create structured action tracking for service recovery and improvement | Vikram Iyer    | Medium              |

## 4 Purpose Of Document

The purpose of this BRD is to define the business need, scope, and requirements for improving customer experience for Bupa members. The document will support stakeholder alignment, solution design, prioritization, testing, and implementation planning.

## 5 Scope

| In Scope                                                                                                                                                                                   | Out Of Scope                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| NPS reporting by product line, tenure band, and claimed/not claimed customer segments; customer dissatisfaction theme analysis; action tracking for critical issues; leadership reporting. | claims engine replacement, policy system redesign, pricing model changes, and any unrelated HR or finance processes. |

## 6 Definitions, Acronyms and Abbreviations

| Abbreviation/Acronym | Description                    |
|----------------------|--------------------------------|
| NPS                  | Net Promoter Score             |
| BRD                  | Business Requirements Document |
| CX                   | Customer Experience            |
| BRD                  | Business Requirements Document |
| SLA                  | Service Level Agreement        |

## 7 Assumptions

| Ref | Assumption                                                                          | Detailed BRS Reference |
|-----|-------------------------------------------------------------------------------------|------------------------|
| A01 | Customer feedback data will be available monthly                                    | FR-01                  |
| A02 | The attached CSV contains supporting cross-check data for the same business domain. | FR-04                  |
| A03 | Stakeholders will confirm ownership for action tracking                             | FR-02                  |
| A04 | Data definitions for promoter/passive/detractor remain stable                       | Governance             |

## 8 Risks

| Ref | Risk                                                       | Detailed BRS Reference |
|-----|------------------------------------------------------------|------------------------|
| R01 | Delayed action ownership across business teams             | FR-03, FR-04           |
| R02 | Poor data quality in customer feedback tagging Assumptions | FR-01, FR-02           |

## 9 Issues

| Ref | Issue                                                              | Detailed BRS Reference |
|-----|--------------------------------------------------------------------|------------------------|
| I01 | Current action tracking is inconsistent across teams               | Document Control       |
| I02 | Some customer comments are unstructured and may need manual review | FR-05                  |

## 10 Dependencies

| Ref | Dependency                                              | Detailed BRS Reference |
|-----|---------------------------------------------------------|------------------------|
| D01 | Access to customer feedback and dashboard data          | FR-01, FR-02           |
| D02 | Business sign-off from CX, Claims, and Operations teams | FR-04, FR06            |

## Stakeholders

1. Business Sponsor - owns funding, outcome, and sign-off.
2. Business Analyst - documents scope, rules, and traceability.
3. Data Analyst - profiles, validates, and transforms pension data.
4. Reporting / Analytics Users - consume pension outputs for business insight.
5. QA / UAT Users - validate that outputs align to business expectations.

## 11 As Is Process

Currently, customer feedback is reviewed after interactions, but action ownership and structured service improvement are not consistently linked to NPS themes. Claimed and long-tenure customers show strong negative sentiment, suggesting breakdowns in service turnaround, communication, and claim experience.

## 12 Context Diagram

The project sits between Customer Experience, Operations, Claims, Product, and IT reporting teams. Inputs include customer survey responses, claims interaction data, product line segmentation, and member verbatim comments; outputs include dashboards, action plans, service improvement initiatives, and management reporting.

## 13 Process Overview Diagram

High-level process: Collect customer responses -> classify as promoter/passive/detractor -> segment by tenure, product line, and claim status -> identify key dissatisfaction themes -> assign corrective actions -> track impact on NPS trend.

## 14 High Level To Be Business Requirements

Bupa should have a structured process to monitor customer sentiment, identify root causes of dissatisfaction, prioritize service actions, and measure results over time. The future process should support better visibility of poor-performing customer segments and faster response to critical service issues.

## 15 Detailed Business/IT Requirements

### 15.1 Functional Requirements

| ID    | Title                          | Requirements Description                                                                                                                  | Type (*)    | MoSCoW Priority | Originator | Status (**) | Delivered By     | Test ID |
|-------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------|------------|-------------|------------------|---------|
| FR-01 | NPS Data Consolidation         | System should consolidate customer response data across monthly periods and segment it by product line, claim status, and tenure band.    | Information | Must            | BA         | Proposed    | IT/<br>DATA Team | TC-01   |
| FR-02 | NPS Dashboard Reporting        | Solution should display overall NPS, promoter, passive, and detractor values with trend views and segment filters.                        | Application | Must            | BA         | Proposed    | BI Team          | TC-02   |
| FR-03 | Dissatisfaction Theme Tracking | Business users should be able to track major dissatisfaction themes such as slow response time, service gaps, and claims dissatisfaction. | Business    | Must            | BA         | CX Team     | Data Team        | TC-03   |
| FR-04 | Action Assignment Workflow     | System/process should allow ownership assignment for improvement actions against high-risk customer themes and segments.                  | Business    | Should          | BA         | Proposed    | Data Team        | TC-04   |

|       |                         |                                                                                                                                       |             |             |             |          |                   |       |
|-------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------|-------------|-------------|----------|-------------------|-------|
| FR-05 | Segment-Based Alerts    | Business should receive alerts for critical segments with persistently poor NPS, such as claimed customers or high-detractor cohorts. | Integration | Should Have | Vikram Iyer | Proposed | IT/Reporting Team | TC-05 |
| FR-06 | Management Summary View | Provide summary view for leadership with key risks, trends, and recommended actions.                                                  | Application | Could Have  | Rahul Mehta | Proposed | BI Team           | TC-06 |

MoSCoW Rating:-

- **Must Have:** Describes a requirement that must be satisfied in the final solution for the solution to be considered a success.
- **Should Have:** Represents a high-priority item that should be included in the solution if it is possible. This is often a critical requirement but one which can be satisfied in other ways if strictly necessary.
- **Could Have:** Describes a requirement which is considered desirable but not necessary. This will be included if time and resources permit.
- **Would Have:** Represents a requirement that stakeholders have agreed will not be implemented in a given release, but may be considered.

## 15.2 Process Diagram

### Detailed process linkage:

Suggested process flow: Capture feedback -> classify sentiment -> analyze by segment -> identify root cause themes -> assign action owner -> track completion -> monitor monthly NPS movement.

### 15.3 Non Functional Requirements

| ID     | Title        | Requirements Description                                                                                                    | Type (*)     | MoSCoW Priority | Originator                     | Status (**)        | Delivered By   | Test ID |
|--------|--------------|-----------------------------------------------------------------------------------------------------------------------------|--------------|-----------------|--------------------------------|--------------------|----------------|---------|
| NFR-01 | Performance  | Dashboard pages should load within 3 seconds for standard reporting views.                                                  | Performance  | Must            | BA                             | IT Project Manager | IT/DataTeam    | NTC-01  |
| NFR-02 | Availability | Reporting solution should be available during business hours with agreed downtime windows communicated in advance.          | Availability | Must            | BA                             | IT Project Manager | IT Team        | NTC-02  |
| NFR-03 | Security     | Access should be role-based so only authorized users can view customer-level or management-sensitive information.           | Security     | Must            | BA                             | Proposed           | IT Security    | NTC-03  |
| NFR-04 | Usability    | Business dashboard and reports should be easy to use for CX, Claims, and Operations stakeholders without technical support. | Usability    | Should Have     | Business Project Manager       | Proposed           | BI Team        | NTC-04  |
| NFR-05 | Auditability | System should keep timestamp and ownership details for action tracking updates.                                             | Audit        | Should          | Director – Customer Experience | Proposed           | IT/Ops         | NTC-05  |

| Processing Times                                      | Functions, calculations, imports, exports                                      |
| Query & Reporting Times                               | Initial loads & subsequent loads                                               |
| <b>CAPACITY</b>                                       |                                                                                |
| Throughput                                            | How many transactions per hour does the system need to be able to handle?      |
| Storage                                               | How much data does the system need to be able to store?                        |
| Year on year growth requirements                      |                                                                                |
| <b>AVAILABILITY</b>                                   |                                                                                |
| Hours of Operation                                    | When is it available? Consider weekends, holidays, maintenance times etc       |
| Locations of Operation                                | Where should it be available from; what are the connection requirements?       |
| <b>RELIABILITY</b>                                    |                                                                                |
| Meantime Between Failures                             | What is the acceptable threshold for down-time eg. one a year, 4,000 hours etc |
| Meantime To Recovery                                  | If broken, how much time is available to get the system back up again?         |
| <b>INTEGRITY</b>                                      |                                                                                |
| Fault Trapping                                        | How to handle electronic interface failures                                    |
| Bad Data Trapping                                     | Data imports; flag-and-continue or stop the import policies etc                |
| Data Integrity                                        | Referential integrity in DB tables and interfaces                              |
| Image Compression & Decompression Standards           |                                                                                |
| <b>RECOVERY</b>                                       |                                                                                |
| Recovery process                                      | How do recoveries work; what is the process?                                   |
| Recovery Timescales                                   | How long should a recovery take to perform?                                    |
| Backup Frequencies                                    | How often is the transaction data, set-up data and system (code) backed up?    |
| Backup Generations                                    | What are the requirements for restoring to previous instance(s)?               |
| <b>COMPATIBILITY</b>                                  |                                                                                |
| Compatibility With Shared Application                 | What other systems does it need to talk to?                                    |
| Compatibility With 3 <sup>rd</sup> Party Applications | What other systems does it have to live with amicably?                         |
| Compatibility On Different Operating Systems          | What does it have to be able to run on?                                        |

|                                                       |                                                                                                 |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <i>Compatibility On Different Platforms?</i>          | <i>What are the hardware platforms it needs to work on?</i>                                     |
| <b>MAINTAINABILITY</b>                                |                                                                                                 |
| <i>Conformance to Architecture Standards</i>          | <i>What are the standards it needs to conform to or have exclusions from?</i>                   |
| <i>Conformance to Design Standards</i>                | <i>What design standards must be adhered to or exclusions created?</i>                          |
| <i>Conformance to Coding Standards</i>                | <i>What design standards must be adhered to or exclusions created?</i>                          |
| <b>USABILITY</b>                                      |                                                                                                 |
| <i>Look And Feel Standards</i>                        | <i>Screen element density, layout and flow, colours, UI, metaphors, keyboards and shortcuts</i> |
| <i>Internationalization/Localization Requirements</i> | <i>Languages, spellings, keyboards, paper sizes etc</i>                                         |
|                                                       |                                                                                                 |

## 16 Business Impact Assessment

| Lens      | Key Impacts                                                                                                 |
|-----------|-------------------------------------------------------------------------------------------------------------|
| Process   | Improved review of customer feedback, clearer ownership, faster escalation of dissatisfaction drivers.      |
| People    | CX, Claims, Operations, and reporting teams will require role clarity and periodic review governance.       |
| Customer  | Expected improvement in communication quality, response experience, and trust for impacted customer groups. |
| Financial | Potential reduction in churn risk and reputational impact; detailed benefit model to be assessed later.     |
| Data & MI | Requires clean tagging of customer themes, stable reporting definitions, and periodic dashboard validation. |

## 17 Appendices

### Appendix A:

The OECD pension dataset includes structured dimensions such as country, indicator description, year, unit, and value. Example business measures found in the source include Current retirement ages for a person who entered the labour force at age 22, Future retirement ages for a person who entered the labour force at age 22, Gross pension replacement rate, Net pension replacement rate, Gross pension wealth, Net pension wealth, Life expectancy at birth, Average worker earnings.

### Appendix B:

This BRD has been drafted in the style of the attached Loan Processing System BRD while adapting the content to the pension data files and pension project reference output.
